\*\* If any emergency situation occur, seek Veterinary care asap. Don't wait as this may be too late or make it more difficult to treat. Brachycephalic dogs are more prone to heat induced seizures or complications with breathing. Please closely monitor your dog(s) for warning signs and take appropriate actions and call your vet or a nearby vet clinic asap. This checklist as well as the post is only a guide to serve as a helpful tool for you and your pup. Always consult with your veterinarian before administering any medications. Good to do this prior to your trip to keep this list in your kit.\*\*
